De Gym Management System

The (De) Gym Management System is a CLI-style program that provides all the necessary utilities to manage a fitness center, featuring a CLI for advanced users and a TUI for user friendliness, as well as a modular user permissions system. Since it's written in python, it is supported for Windows, Linux, and Mac.

Usage

Installation

```
git clone https://github.com/pcb1631/PYP
```

Or download the zip file and extract it TO ONE FOLDER AS-IS.

Running the project

IDEs will always have issues with input and rendering, so it is reccomended that you use a dedicated terminal like CMD/Powershell or Ghostty.

```
python main.py
```

OR

```
python ./PYP/main.py #the directory of the project
```

Or double click main.py on Windows.

But in real world use, it is assumed that the script is in a full screen terminal preventing the user from stopping the script, with whatever means necessary

For example:

In a Linux distro, run this script at startup in a TTY without a display manager. This way it is gurranteed the user never exits the script.

```bash
#!/bin/bash

trap '' SIGINT #ignore CTRL + C interrupt

while true; do
    python main.py
done
```

TUI

The TUI will be the first thing you encounter in the project.

The first line is the prompt, the lines in the middle are the options, and the last line is fuzzy search. Your selection is the highlighted option

Press arrow keys to change selection and enter to confirm

Typing will make a query, and uses fuzzy search to change your selection to the closest match.

Press CTRL+C to cancel
